

Managing IT Power Lifecycle Costs Offering

As energy costs continue to rise, new initiatives and mandates related to Green IT are quickly rising to the top of many CIO's approved projects. Information and power control are the first steps to reducing consumption. Symantec is pleased to offer a Consulting Services offering focused on helping customers understand and improve their current energy consumption.

Using Altiris and eiPower Saver Solutions (EPSS) software, customers can easily manage energy consumption and achieve ROI in a short amount of time. The solution provides scenario-based modelling reports, helping customers understand their complete energy position in kWh Usage, Cost, and Carbon Emissions for Windows workstations. Customers have achieved saving ranging from \$20-\$65 a workstation per year. EPSS may also qualify customers for energy rebates, providing a zero cost entry, and immediate ROI.

altiris consulting services

This 2 week consulting engagement focuses on the following activities:

1. Configure the Altiris solutions on a lab server.
2. Deploy Altiris agent to the target systems (up to 50 production workstations).
3. Configure energy savings policies and roll out the agent to collect power events.
4. Discover commonly known EPA power savings devices.
5. Review Energy and Carbon savings reports demonstrating the impact of the various power saving configurations.
6. Deploy appropriate power saving configurations.
7. Provide knowledge transfer and recommendations on how additional saving may be achieved through a broader deployment of the solutions.
